Installation

The unit can be installed as CD Changer 1, 2 or SAT interface depend on the radio model. It is recommended that the microphone is installed at the rear view mirror and USB in the glove box.

Operation

The unit automatically pairs when the car starts and starts playing when USB cable is connected. Switch between wireless and USB player or unlock iPod screen. If you have an iPod the songs can be managed by playlists and navigated via the radio track up/dn buttons and the steering wheel controls, playlists can be changed by disk up/dn buttons. If you have USB flash or Android and Windows phones the songs will be played as from a mass storage device by its directory structures. The track name and playlist/directory will be displayed on the radio screen. Audio will sound with high quality through the car speakers. Incoming phone calls will be accepted by pressing track up and rejected with track dn. The phone number and the name of the caller will be announced via the speakers unless privacy mode is selected. When you need to call you can browse the phone book by alphabet and names and call the person you select.
